

[ILLUMINATED CELLULAR PHONE CAR CHARGER AND ILLUMINATING APPARATUS]

Abstract

A cellular phone car charger with an illuminating function comprising a power connection plug, a conductive cable, a charge connector and an illuminating device is provided. The power connection plug is connected to a power socket within a car for providing a charging power source. The conductive cable transmits the charging power source to the charge connector. The charge connector converts the charge power source into a form suitable for charging up a cellular phone. The illuminating device is set on the charge connector capable of using the charging power to illuminate surrounding areas. The illuminating device can also use the power source within the cellular phone to illuminate surrounding areas when the power connection plug is in an idle state and the charge connector is engaged to the cellular phone. The on or off state of the illuminating device can be controlled by a switch.
